

Horn sounding

1. Course Content

Note: This program runs on a sandbox map; you will need to adjust the program for your personal map.

1. Learn the actions the car takes after recognizing the horn.
2. Learn the newly introduced key source code.

2. Horn Detection

Horn detection source code path:

```
/home/jetson/yahboomcar_ros2_ws/yahboomcar_ws/src/auto_drive/auto_drive/yolo_detect.py
```

```
/home/jetson/yahboomcar_ros2_ws/yahboomcar_ws/src/auto_drive/auto_drive/auto_drive.py
```

3. Program Startup

3.1 Startup Command

- Start the camera + chassis + road signs, lane lines

```
ros2 launch auto_drive auto_drive_bringup.launch.py
```

```
jetson@yahboom: ~

```

After the program runs, a YOLO recognition screen will be displayed. The car will move centered within the lane and perform corresponding actions based on the road signs it detects during its journey. (If the terminal does not report any errors after starting the program, but the car does not move, you can run the following program to check the parameters.)

- Start the dynamic parameter configuration node

```
ros2 run rqt_reconfigure rqt_reconfigure
```

If the car doesn't move, check two parameters: whether **START_AutoDrive** is checked and whether **combine_nav** is false.

✓ After modifying the parameters, click in the blank area of the GUI to enter the parameter values. Note that this only applies to the current startup; for permanent effects, the parameters need to be modified in the source code.

3.2 Car Movement After Horn Detection

The program will honk several times when it detects the horn.

```

[auto_drive-4] [INFO] [1764674618.915651776] [auto_drive]: car horn

```

The car will move while honking.

The stop-point parking function is in the `auto_drive.py` file. Below is the function entered after the horn is detected. Users can modify the car's movement after detecting the road sign.

```
def car_horn(self):
    '''Horn'''
    self.get_logger().info('car horn')
    self.play_audio(self.honk_audio_path)
```

4. Source Code Analysis

4.1、 auto_drive.py

YOLO signpost message reception:

```
def sign_callback(self, msg:DetectionObject):
    '''Subscribe to YOLO recognition results'''
    class_name = msg.class_name
    object_distance = self._get_distance(msg.ymin) # Calculate distance
    object = Object(msg.class_name, msg.confidence, object_distance)
```

Multiple filtering mechanisms: mainly to prevent continuously recognizing road signs and triggering actions; the action will only be unlocked when different road signs are recognized.

```
# 1. Check if any other actions are being performed.
if self.action_running:
    return
```

```

# 2. Check cooldown time (to prevent repeated triggering)
current_time = time.time()
if class_name in self.last_processed_time:
    time_diff = current_time - self.last_processed_time[class_name]
    if time_diff < self.cooldown_time: # Default cooldown: 3 seconds
        return

# 3. Check if it is a duplicate road sign.
if class_name == self.last_sign:
    return

# 4. Check if the road sign is enabled.
if not self.sign_enable_list[对应的索引]:
    return

```

Event queue processing

```

def handle_events(self):
    '''Handling target recognition events'''
    while True:
        if not self.event_queue.empty():
            object = self.event_queue.get()
            self.action_runing = True
            current_sign = object.class_name

            try:
                # Perform the appropriate action based on the type of road sign.
                if object.class_name == "straight" and
self.sign_enable_list[10]:
                    self.go_straight()
                elif object.class_name == "turnright" and
self.sign_enable_list[11]:
                    self.turn('right')
                # ... Other road sign processing

            finally:
                # Update status record
                self.last_processed_time[current_sign] = time.time()
                self.last_sign = current_sign
                self.action_runing = False

```

Specific action implementation

```

def car_horn(self):
    '''Horn'''
    self.get_logger().info('car horn')
    self.play_audio(self.honk_audio_path)

```
